5 • Driver Correlation Matrix

TV and Digital ad spend move together strongly (shared marketing budget) — both correlate similarly with sales, which is why the regression cannot cleanly separate their individual effects.

	Digital Ad Spend	TV Ad Spend	Radio Ad Spend	Print Ad Spend	Stockout Rate	Is Festival	Parking	Monthly Sales
Digital Ad Spend	1.00	0.83	0.71	0.63	-0.08	-0.05	-0.03	0.78
TV Ad Spend	0.83	1.00	0.67	0.59	-0.10	-0.04	-0.06	0.80
Radio Ad Spend	0.71	0.67	1.00	0.53	-0.07	-0.01	-0.02	0.69
Print Ad Spend	0.63	0.59	0.53	1.00	0.01	0.01	-0.06	0.56
Stockout Rate	-0.08	-0.10	-0.07	0.01	1.00	0.08	-0.02	-0.20
Is Festival	-0.05	-0.04	-0.01	0.01	0.08	1.00	0.05	0.05
Parking	-0.03	-0.06	-0.02	-0.06	-0.02	0.05	1.00	-0.02
Monthly Sales	0.78	0.80	0.69	0.56	-0.20	0.05	-0.02	1.00

Recomputed live on the filtered slice. Blue = positive, red = negative, white = no relationship.

Summary Insights & Recommendations

Key Findings

- Location is the single biggest lever. Metro stores out-sell Suburban stores by roughly Rs 750K/month in the model, far more than any marketing lever can close.
- TV and Radio spend carry the ad-budget signal, not Digital — Digital's raw correlation with sales (r≈0.78) is high but statistically insignificant once TV/Radio are in the model (they are highly collinear, VIF≈4.5).
- Stockouts are a quantifiable revenue leak: each 1-point rise in stockout rate costs ~Rs 11K/month per store, and it is one of the few levers under operations' direct control.
- Festival months add a reliable, predictable uplift (~Rs 91K) independent of ad spend — useful for inventory and staffing planning, not just marketing.
- The model explains ~83% of test-set variance (R²) with an average error of ~12% of mean sales — good enough to guide budget allocation, not precise enough for store-level payroll decisions.

Recommendations

- Rebalance ad budget away from Digital toward TV/Radio for stores currently digital-heavy, pending a controlled test — Digital's apparent lift is likely riding on overall budget size, not its own channel effect.
- Fund stockout reduction before further ad spend increases. A store cutting stockout rate from 15% to 5% gains an estimated ~Rs 112K/month — often cheaper than an equivalent lift from ads.
- Prioritize new-store investment in Metro/Urban catchments where the location effect compounds with every other driver, rather than opening new Suburban locations at parity spend.
- Staff and stock up ahead of festival months using the ~Rs 90K predictable uplift as a planning baseline, independent of that month's ad spend.
